

Dr. Fadhli performs this procedure as an out patient surgical procedure unusually he takes his patients to the hospital or surgical facility. While the patient is given general anesthesia Dr. Fadhli will proceed with the tube insertion. Sometimes it may be done only on one ear while usually in smaller children it is done bilateral. Once the patient awakens from this procedure there is very little or no pain at all. Usually regular Tylenol will be sufficient if anything is needed at all.

A small incision is made in the tympanic membrane

Tube inserted to drain fluid
